Antimicrobial Dressings Apr 05 2021 Antimicrobial Dressings: The Wound Care Applications explores the literature surrounding the catalytic behavior of proteolytic enzymes immobilized together with nanoparticles. As numerous applications using proteolytic enzymes for debridement, silver as antibiotic and nanoparticles for enzyme immobilization were developed in the last years, this book explores interdisciplinary information combining nanotechnology, biotechnology and medicine and how it's still in early stages. The book adopts a holistic approach in a lifecycle context to evaluate their final feasibility, including industrial exploitability without disregard of the potential risks of enzymes and nanomaterials to human health and the environment. Describes the drawback of using unstable enzymes in wound debridement such as infections, irritations, low availability, rapid elimination from the body, and impossibility of creating a high local concentration of the preparation without increasing its systemic concentration Provides information on higher efficient antimicrobial property and enzyme stability using nanoparticles as carriers for enzyme immobilization due to minimum diffusional limitation, maximum surface area per unit mass, and high enzyme loading Discusses the physical characteristics of the nanoparticles through multilayer polyelectrolytes encasing, such as diffusion and particle mobility that will influence the catalytic activity, pH and thermal stability of attached enzymes

Advances in Wound Healing Materials Aug 09 2021 Wound healing and wound care technologies are an ever expanding field with the advancement of materials science, biomedicine and tissue engineering. In the year 2011 the global wound care market generated US\$ 6,500 million with an annual growth rate of 7.5%. The global advanced wound care products market share in 2023 is predicted to be approximately US\$ 16,300 million. This book discusses the evolution of wound care devices and protocol over the years and different technologies being used in the present day wound care treatment. New strategies involving engineered tissues and drug delivery to mimic the natural wound healing milieu are discussed. The use of cytokine growth factors enhances chronic wound healing particularly for burn wound healing. Prevention of scarring, keloid formation or contractures and a cosmetically acceptable healing is a challenge even now. Skin tissue engineering was the first successfully clinically applied product in regenerative medicine. Bioengineered skin seeded with fibroblast and keratinocyte cells could form a permanent solution that do not require skin grafting or as a temporary cover for burns prior to grafting. Cell attachment, proliferation and tissue formation in a three-dimensional porous scaffold can be engineered for specific application. These cell based skin substitutes had significant wound healing and scar reducing effect on patients. Gene-activated dermal equivalent is another emerging approach for the healing of full thickness incision wounds with good remodelling of the skin. The book also describes similar latest developments on wound healing science and research. The target audiences are wound care professionals, researchers working on wound healing technology and skin tissue engineering; as well as graduate students and industries that need to understand the aspects of wound healing and technological orientation towards successful commercialisation.
